

## When Should Treatment Be Initiated for Patients Diagnosed with Early-Stage Myelofibrosis (MF)?

Time	Question
00:58	How many of the patients that you see are at the early-phase of the disease and what's the burden of disease based on your observation?
01:54	How do you define these patients? Do you use the traditional prognostic scoring system or presence of symptoms?
02:38	What has your experience been so far?
03:40	How would you approach these early-stage patients who are symptomatic?
05:34	Should every patient with Myelofibrosis be treated within the context of a clinical trial or in standard therapy that we think can potentially change the natural history early on?
06:57	What is your preferred approach to treatment in patients who are already symptomatic with enlargement of the spleen?
09:00	Are low risk patients candidates for Interferon or is there a need for another study? How long are the studies going to last?
12:47	If the patient does not clearly have symptoms, would you start this patient on any form of therapy?
